

Challenge

Fisher Controls International, a division of Emerson Process Management, needed an integration suite to help them meet PIDX standards for communicating electronically with one of their major clients, a multinational, integrated oil company.

The Stone Bond Solution

EE-B2B eCommerce integration suite to facilitate invoice transmission. EE-B2B is an affordable, information flow management exchange solution enabling trading partners to control the translation of all types of eCommerce documents (e.g. EDI, CSV, etc.) and data directly from a backend system, into the Petroleum Industry Data Exchange (PIDX) compliant XML format and ensures information is securely transmitted over the Internet. Fisher implements PIDX with EE-B2B, improving timely delivery of invoices and reducing errors.

Fisher Controls International, a division of Emerson Process Management, uses EE-B2B to implement PIDX standards for communicating electronically with multinational clients. EE-B2B is an information flow management exchange solution that enables Fisher Controls International to control the translation of eCommerce documents and data directly into the PIDX compliant XML format. EE-B2B monitors for Fisher's new invoices and immediately converts them to PIDX-compliant XML, improving timely delivery of invoices and reducing human errors.

Benefits

Behind Fisher's firewall, EE-B2B will monitor for new invoices and immediately convert them to PIDX-compliant XML, handling attachments, receipts and acknowledgements while delivering invoice data direct to Fisher's customer. Automation reduces the susceptibility to errors, resulting in a higher percentage of validated and accepted invoices, and ultimately increased cash flow.
