

Challenge

JM Huber and Kiodex communicated trade transactions through a paper trail system that at first glance would present some obvious limitations in their business relationship. One of the limitations of this system would be the countless number of hours of manpower it takes to generate these files and communicate them with each other.

The Stone Bond Solution

Enterprise Enabler empowered this business relationship by automating this procedure and validating the data while applying complex business rules in real time. One of the values that Enterprise Enabler also added to this relationship is that each party does not have to change their infrastructure for their piece to fit in the integration puzzle. Enterprise Enabler extracts daily trading information from JM Huber trading system and transforms it to be compatible with the Kiodex. Enterprise Enabler then sends the data across securely to the risk management software and captures the results, feeding them back to JM Huber in the form they require.

Benefits

With a small footprint that was configured in a few days, Enterprise Enabler reduced the time and risk involved with manual login and data entry in the Kiodex web-based screens.
